WASHINGTON
GOVERNMENT PRINTING OFFICE
1920
INTRODUCTION.

The right handling of the home forest has come to be a matter of recognized importance in farm management. Farming touches forestry at a number of different points. The farm requires timber for the building and repair of houses, barns, sheds, fences, and telephone lines. It needs more or less wood for fuel, and it should have some woodland also for protecting the soil against erosion on steep slopes, for shelter for growing crops and live stock against the hot, dry winds of midsummer, the cold winds of winter, and likewise for the comfort of man, and the home of game animals.

A farm without some woods is less attractive as a place to live and usually less valuable than one with at least a little woodland and some forest trees scattered about. Thus woodlands have a place both in the management of the farm and in the development of the community.

The lessons which follow present the subject of farm forestry from the standpoint of the important local kinds of forest trees and their uses, the proper location of woodlands on the farm, their economic value to the farm, the different farm timber products, measuring and marketing timber, utilizing timber rightly on the farm, protecting and improving woodlands, and planting young timber. A knowledge of farm forestry, applied along simple lines, should make farm-
ing more profitable. These lessons have been prepared to give to
the organized school work in elementary agriculture additional
impetus in forestry, to provide material for instruction that is within
the range of elementary pupils, and to furnish a topic for home
projects that may be worked out profitably to every community and
with real educational value to the pupils themselves.

**SOURCES OF INFORMATION.**

Practically all the subject matter for class use and instructions
for home projects will be found in bulletins available, either free or
at a small cost. Almost every State agricultural college has pub-
lished one or more bulletins on some phase of forestry, and in most
instances these may be had for the asking. Address the dean of the
agricultural college.

The Farmers' Bulletins of the United States Department of Agri-
culture referred to in this bulletin will cover many of the topics to
be studied. Bulletins in this list will be sent free, so long as the
supply lasts, to any resident of the United States, upon application
to his Senator, Representative, or Delegate in Congress, or to the
Chief of the Division of Publications, U. S. Department of Agri-
culture, Washington, D. C. Because of the limited supply, appli-
cants are urged to select only a few numbers, choosing those which
are of special interest, and ordering but one copy of each. When
the free supply has been exhausted, a number are yet for sale by
the Superintendent of Documents, Government Printing Office,
Washington, D. C., at 5 cents each. Other publications of this
department are also for sale by the Superintendent of Documents,
but these are more often technical bulletins and of interest to those
only who wish to specialize in the subject.

Frequently revised classified lists of department publications on
different phases of agriculture, one of which is on the subject of
forestry, are issued by the Division of Agricultural Instruction,
States Relations Service, U. S. Department of Agriculture, for teach-
ers' use. The teacher will find that a number of the textbooks on
forestry are suited to her needs, and that some of the elementary
textbooks may be used by the pupils.

In addition to the Farmers' Bulletins and other Department Bulle-
tins, the Forest Service issues a number of circulars on various
phases of forestry which may be obtained directly from that division.

**THE SURVEY.**

One of the means by which the teacher may become informed
about the forestry interests of the district is a woodland survey.
The pupils may assist in obtaining this information, but a first-hand
knowledge obtained by the teacher will be a valuable aid.
This survey should include the kind of woodland, whether hardwood, conifer, or mixed type, the important species of trees in the forest stand, in respect to their abundance and their use and commercial value, the leading rough timber products that have been sold, and the prices received in the woods or shipping point. This information may be collected and tabulated.

A map of the district may be procured, or, if not available, one can be drawn on a large sheet by the pupils. On this map the homes and farms of the pupils are to be located. Place signs, emblems, or colored bits of paper to represent various facts from your tabulations; for example, colored circles to represent young, middle age, or mature woodland, squares to represent timber products sold, etc. Additional facts may be placed on this map, taking especial note of the acreage per farm, interest in taking care of standing timber, etc.

ILLUSTRATIVE MATERIAL.

Construct a chart showing the relation in size of crown and trunk of a typical tree growing in the open (limby) and a tree in a close stand (long, smooth trunk). Illustrate by a diagram the maximum wood production per acre and quality production of good timber, by a crowded stand of trees and a thinned stand formerly containing more trees per acre.

Make drawings of the cross section of a tree trunk showing how the tree increases by a new ring of growth each year. Collect leaf specimens of the trees of the district and mount same on cardboard after pressing and drying them. Collect samples of the wood of the trees of the locality of approximately uniform size and mount them on boards, or hang them in frames or racks especially constructed.

If possible, obtain like specimens of the woods of other localities. These samples may be classified and mounted into groups such as hardwoods and softwoods, or oaks, maples, pines, etc. At least a small collection of such woods should be a part of the equipment of every school: Charts showing the relative importance and uses of the most abundant woods should be made.

Write to the Division of Agricultural Instruction, States Relations Service, U. S. Department of Agriculture, Washington, D. C., for list of lantern-slide sets with lecture syllabi on the different phases of forestry. These sets of slides are loaned to teachers free of charge.

THE HOME PROJECT.

It is agreed by teachers of agriculture that instruction in that subject should follow certain definite lines: (1) It should be seasonal. (2) It should be local in its interests and development. (3) It should meet the interests of the pupils. (4) It should be practical.
The home-project plan affords the best means of meeting these conditions, especially the practical side. The pupil is working out for himself the principles and theories taught in the classroom.

The term "home project," applied to instruction in elementary and secondary agriculture, includes each of the following requisites: (1) There must be a plant for work at home covering a season more or less extended. (2) It must be a part of the instruction in agriculture of the school. (3) There must be a problem more or less new to the pupil. (4) The parents and pupil should agree with the teacher on the plan. (5) Some competent person must supervise the home work. (6) Detailed records of time, method, cost, and income must be honestly kept. (7) A written report based on the record must be submitted to the teacher. This report may be in the form of a booklet.

Type of forestry project.—A project in forestry must of necessity be of a much different type than a project in farm crops or animal production. The slow growth of forest trees and other factors involved make it a project covering more than one season. However, forest projects can be conducted and made of much value to the student and community. Among the forestry projects that can be carried out, the following are suggested: The renovation of a farm woodland, the replanting of a woodland and subsequent care of the young trees, the planting of forest trees on some eroding lands or other waste ground on the farm, mapping and finding area of a forest tract, cutting and marketing farm forest products, giving especial attention to the proper cutting of trees and to the removal of the parts of the trees not marketed, a study and survey of forest fires, insect enemies, and the diseases of the common forest trees.

Lesson I. FOREST TREES AND FOREST TYPES.

Problem.—To learn to know at sight the chief forest trees of the locality.

Sources of information.—Bulletins of the State colleges of agriculture and State foresters on forest trees; Forestry Bulletin 17; forest tree key and description of 100 important forest trees on pages 40-48 of Supplement. The Forest Service, U. S. Department of Agriculture, Washington, D. C., is ready to identify leaves, fruit, buds, and wood that puzzle the young forester.

Illustrative material.—The best illustrative material for this lesson is to be found in the woods, where the trees may be seen and their characteristics studied. In case this can not be done, pictures of typical trees may be used. Blackboard sketches showing the form of different trees are easily made and should be used in this lesson.

Topics of study.—Getting acquainted with the important kinds of forest trees in your locality. Their various common names and other
names. A few trees are known widely by the same common name, but many are called by different names in various sections of the country. The importance of botanical names for certain identification. Distinguishing the different kinds or species of trees by some well-marked characteristics of leaf, bark, fruit, seed, buds, or twig arrangement.

Conifers: Trees bearing cones, such as the pines, spruces, firs, hemlocks, cedars, junipers, tamarack, and cypress. How does bald cypress differ from the others? Distinguishing characteristics of each group or genus, and something about its different members or species, particularly those that occur locally.

Hardwoods: Trees, most of which have wood harder than that of the conifers and broad leaves which are deciduous, or are shed in the fall. Kinds of hardwood trees which are evergreen. Group the hardwood trees into general groups, such as the oaks, maples, elms, and others, and identify as many different species of each as possible.

Kinds of trees which are associated together in different forest types, such as (a) ridge type, (b) slope or cove type, (c) bottomland type, and (d) swamp type. What trees locally are associated to make (a) coniferous forest type, (b) pure hardwood type, and (c) mixed hardwood and conifer type.

Practical exercises.—Gathering leaves and fruit of the important local forest trees; press in wrapping paper, folded and labeled with place and date.

Studying the shape and size of leaves: trace a leaf of each of the important kinds of trees, and label with name, place where found, and date.

Grouping trees by kinds of fruit borne—nuts, keys, berries, cones, etc.

Collect samples of winter buds from leading kinds of trees, labeling with name of tree, place of collection, and date.

Study of winter buds, with drawings of buds and twig arrangement.

Collect tree blossoms from red and silver maples, willows, catalpa, elm, oak, dogwood, tulip poplar, basswood, buckeye, and magnolia.

Field study,1—Now to the woods, that may come into personal touch with the forest trees of your own neighborhood.

Leaves: The leaf is the trade-mark of the trees. Gather the leaves, study and compare them to gain a first knowledge of the trees as individuals, then as groups. The tulip poplar writes its name plainly upon its square-cut leaf, but the boxelder has a leaf somewhat resembling the ash, though its seed is similar to the maple key. Wherein does the ash leaf differ from that of the locust or the

---

1 The sections on field study in Lessons I and III were contributed by Miss Lucy Kellerhouse, of the Forest Service.
The oaks are divided into the red and the white oaks. What is a typical leaf of each class?

Fig. 1.—White oak, a woodland tree of wide distribution and high value, representative of the pure hardwood type.

You will probably begin this study in the autumn, so before the leaves fall and your memory of them fails, press and either mount them or place in paper folders, and label with name, place where found, and date.
If the black gum is now reddening the red gum will soon begin to burn, and presently all the woods will seem as if on fire. The autumn colors will help to identify your trees and beautify your herbarium. A few of the broadleaf trees and all the conifers save one are evergreen.

Separate the conifers into the pines, spruces, cedars, or other cone-bearers of your woods, and divide into as many species as you find. Draw a diagram, and under the two heads, broadleaf trees and conifers, group the trees that you identify, with a short description of each.

Fig. 2.—White oak leaf, flower, fruit, and winter bud: a, Pistillate or female flower; b, staminate or male flower; c, winter bud.
Fruit: While you are gathering leaves, bring in the fruit, or seed, that you find—the pulpy fruit, nuts, berries, pods, winged seed, and tufted seed of the broadleaf trees and the cones of the conifers, and add to your herbarium.
Buds: As the leaves fall, gather the bare branches and study the winter buds that hold next year's leaves and flowers, from the big bud that tips the horse-chestnut to the long, sharp bud of the beech. Label them as you did the leaves.

Bark: The sycamore bark tells its own story, but do you know the bark of the elm from that of the ash? Contrast the glove-fitting bark of the beech with the rough-and-ready coat of the shagbark hickory.

Branches: Each tree has its own way of branching, though its form is not always so definite as the red cedar spire. What is typical of the white oak bough? The leaves of the scarlet and the pin oak are considerably alike, but what is the character of each tree? Draw a leafless elm.

Flowers: When spring comes and the buds are bursting, do not forget the flowers of the forest trees. They form a clock dial for the advancing year. So as they bloom in succession, bring in the blossoms of the willow, the maple, the elm, and the cottonwood, until you have gathered the last flower of June, and seed are on the wing.

While you have been getting acquainted with your trees, you have learned that they prefer certain localities; you have found the willow by the stream, the yellow or tulip poplar in the valley, the red oak on the higher ground, for one needs much moisture in its soil while another will grow in a drier situation. You have discovered that certain trees "hobnob" together because of similar requirements for soil, moisture, and light. In this way you will learn to group your trees into forest types when you begin your practical work as the forester of your home woodland.

Correlations.—Drawing: Sketch the different types of trees in the district; make drawings or tracings of the different shaped leaves. Mount these drawings and file with other illustrative material.

Language: An account of a field trip carefully written will make a good English exercise. A tree booklet describing the different types of trees, telling where they are found, some of their characteristics and uses, illustrated by original drawings and neatly bound with an attractive cover page, will furnish an excellent drill both in language and in drawing.

Lesson II. LOCATION AND EXTENT OF WOODLANDS.

Problem.—To study places about the farm where trees can be grown profitably.

Sources of information.— Farmers' Bulletins 358, 745, 1071, and 1117; Department Bulletin 481.

Topics for study.—Places about the farm where forest trees and woods should be kept. Timber is a poor land crop. Places where
forest trees are profitable: (1) Poor soils. (2) Steep slopes. (3) Eroding soils. (4) Rocky land. (5) Wet land. (6) Unused corners or waste places.

Extent of woodlands in the locality: Proportion of cropland and woodland. The total acres of woods on 10 to 20 representative farms in the locality.

**Practical exercises.**—From the data gathered in the survey construct a chart showing the proportion of cropland and woodland, the total crop acreage and the total woodland acreage. Study the places where you find trees growing and list such locations as indicated in topics for study. What type of trees do you find commonly growing in each of these localities? What farms could profitably plant forest trees? What sort of trees should be planted in case a young forest is established?

**Correlations.**—Drawing: Draw a map of a farm or of the school district, locating the poor soils, steep slopes, eroding soils, rocky land, wet land, unused corners or waste land, and mark on this map the names of the trees that grow on these places or that could be profitably grown thereon.

Language: Write a report showing the advantages of using the poor soils and waste lands for tree planting, giving examples from the farms of the district if possible.

Arithmetic: Problems showing comparative acreage of cropland and woodland, and percentages of each, will be suggested in the study of this lesson.

Lesson III. **ECONOMIC VALUE OF THE FOREST.**

**Problem.**—To learn the value of a forest as conservation of soil moisture, as protection against soil erosion, as a shelter against extremes of temperature, and as a means of increasing the farm income.

**Sources of information.**—Farmers' Bulletins 358, 715, 745, 788, 1071, and 1117; Department Bulletin 481; Yearbook Separate 688; Forestry Misc. F-I.

**Illustrative material.**—The best illustrative material will be found in a field trip to the woods and field. Actual examples of the use of the trees can be pointed out. If a field trip is not practicable, illustrations may be clipped from papers and magazines showing the erosion on unprotected hillsides and the use of trees as shelters in pastures and about the farm buildings.

**Topics for study.**—With an acquaintance formed with the different species of trees, it will be worth while to learn their value both as individual trees and associated together in woodlands.

Timber or wood products. Trees, grouped according to **their value** for wood or timber. (This is expanded in Lesson IV.)
How a forest cover conserves the water from rainfall or melting snow.

Flow of streams from open and forested land; seepage and springs. Protecting watersheds of city reservoirs and headquarters of large streams from erosion and floods. State and municipal forests. The 150,000,000 acres of Government National Forests held for protection of watersheds and streams and for a permanent timber supply. Private owners hold four-fifths of the total standing timber in the United States.

![Fig. 4.—The forest floor. Leaves and twig litter on the ground beneath the trees, spongy layer of decomposed vegetable matter or humus, this and the lower layer of soil interlaced with tree roots and rootlets, and the clay subsoil. Dense growth of seedling and sapling trees covering and protecting the soil.](image)

How trees protect the soil against erosion, and the formation of gullies on steep slopes. Examples of local hillsides and regions of the United States.

Effect of woods as shelter against hot dry winds and cold winds for growing grain and fruit crops, live stock, and the farm home. The difference felt in temperature of the air in midsummer out in the open road or field and in the shade of a single tree or of woods. The same as experienced on a cold windy day in winter.

Field study.—In an excursion with the teacher to the hills and fields the class can learn, by actual observation, the bond between the forest and the river.
As soon as the pupil leaves the open and enters the cool shade of the woods he will note the forest floor—the undergrowth of young trees and shrubs, the ferns and moss, and the litter of fallen leaves. With his jackknife, or a trowel, let him dig down beneath this cover into the mold of many years of fallen leaves. The soil will be spongy and moist. What happens when rain falls or snow melts? Under the shadow of the forest it sinks into the spongy earth. (Fig. 4.)

What becomes of the rain and snow that the forest has soaked up like a sponge? Find a spring. This is where the stored water is seeping out to feed the streams. The rainfall that has been held back in the hidden reservoir of the forest is here transformed into a steady supply of water for the pasture, the mill, and the city.

Let the class now return to the open and dig into the soil on the unwooded slope. It will be found dry and hard. What happens when the rain falls or the snow melts on the open hillside? It is not held back and absorbed, but rushes down the slope. In a heavy rain the streams rise rapidly. Perhaps the class will find a bridge that has been carried away in a freshet. Someone may tell of the log bridge on the farm that was destroyed. Then what happens when the winter snow melts upon the unprotected mountain slopes and the spring rains swell the rivers? (Figs 5 and 6.)
While the class is on the open hillside, places will be found where the soil, which has no roots to bind it, has been washed away by the rain, and on some steep slope there will be deep gullies dug into the ground.

Where does the soil go that is washed down the slope? Into the stream. Perhaps the stream carries the silt into the water supply of a city. If there is a river near, a sand bar may be found that has washed down from the hill country. What do muddy rivers mean to the harbors near the coast? Who has seen a dredge at work scooping up the silt to keep the channel free? This means a vast expense to the country.

The pupil who has noted these facts about woodland, soil, and stream, will begin to see the relation which the forests of our country bear to the well-being of the land. The little examples that he finds in his own neighborhood of soil protection and good streams, of erosion and flood damage, are intimations of the larger meaning of the Nation's forests to farm land and industry and commerce. His own home woodland is a part of nature's plan to aid man and his enterprise.

Lesson IV. PRODUCTS FROM THE HOME FOREST.

Problem.—What products from the home forest can be utilized by the farm both for home use and for the market?

Sources of information.—Farmers' Bulletins 516, 715, 1071, and 1117; Department Bulletins 12, 605, and 753; Yearbook Separate 779.
Illustrative material.—Prepare a wall chart showing in a tabulated form the various wood products. In each product column write the name of the tree or, better still, place a sample of the wood that furnished that product. Prepare another chart showing in like manner other timber products such as nuts, roots, bark, gum, and edible fruits, listing the trees the same as in above chart. Any of the products from root, bark, gum, etc., will also make interesting and useful illustrative material.

Topics for study.—Wood, in a rough state, is the principal farm timber product. What kinds of wood are used for the following rough products: (1) Saw logs; (2) poles and piling; (3) fence posts; (4) bolts, blocks, or billets for (a) cooperage, (b) implement handles, (c) wagon and automobile spokes, (d) pulpwood; (5) crossties; and (6) fuel wood. The sizes and other requirements for each of these various wood products, including the species of trees which are best suited and bring highest prices on the market.

Forest trees which produce nuts of commercial value; roots, bark, gum, and edible fruit. List of these products under each head and what they are used for commercially.

Lumber, manufactured from saw logs, is a secondary product from the woodland. (How to measure sawed lumber treated in Lesson VI.) Its manufacture is essentially that of the sawmill man, rather than the farmer.

Practical exercises.—What is the chief use of wood in the district? What other forest products are made or used here? What trees furnish the greater amount of wood? What kind of lumber is
sawed in the district? What becomes of this lumber? If there are any wood product factories in the district, arrange for a trip to the same and study the various processes from the rough wood to the finished products. What timber in the district is most valuable? Why? An interesting study to make is the part forest products play in the construction of machinery, transportation lines, airplanes, etc.

Correlations.—Geography: Trace the timber products of the district to their market. In a like manner locate the source of timber products brought into the district and trace their probable route. On a State map locate the timber areas and learn, if possible, the important kinds of trees in each area. Locate the great lumber regions of the United States. From what ports are forest products of the United States exported?

Arithmetic: Construct problems in which the prices of timber products are used. Use, if possible, the value of the forest products, the price of timber land, and prices of the miscellaneous forest products.

Language: Make a study of the forest products of the district and write a report of your study. Another report of value will be that on the forest products that are imported into the district.

Lesson V. USING FARM TIMBER.

Problem.—To discover the right uses of farm timber.

Sources of information.—Farmers' Bulletins 516, 711, 715, 744, 1023, 1071, and 1117; Department Bulletins 718 and 753; Forestry Bulletins 80 and 144; publications of State foresters and colleges of agriculture.

Illustrative material.—Again a field trip will furnish the best illustrative material for this lesson. Note the height of the stumps where timber has been cut, the careless felling of trees causing the injuring of young trees, the tops and large limbs left in the forest. In the absence of a field trip, pictures may be shown illustrating the points mentioned above.

Topics for study.—The right using of timber on the farm should begin at the time the tree is cut. Waste of good timber in the woods is altogether too common nowadays, with high values on practically every kind of tree.

High stumps mean usually that the best quality of the timber in the tree is wasted. Often the value of the timber left in high stumps is sufficient to pay for all the costs of logging. Saw logs can now be taken profitably from the tops which had to be left only a few years ago. Wherever possible the tops should be worked up into crossties, mine props, or firewood. By careless felling of trees much promising young timber is broken and destroyed.
High grade and valuable timber should not be used in places about the farm where less valuable woods will answer the purpose. Sometimes choice white oak worth $40 a thousand feet in the log for veneers, is split up into fence posts, or black walnut used for farm gates because it "won't split." Substitutes can be found by children upon inquiry from their parents or neighbors.

Small and young timber cut in making improvement thinnings in overcrowded stands can often be sold or used on the farm for posts, poles, or firewood, instead of being allowed to decay in the woods.

Treating of fence posts: Short-lived woods when soaked in hot and then in cold creosote last from 10 to 20 years as fence posts. As the supply of long-lived woods, such as black locust, osage orange, red cedar, chestnut, mulberry, and catalpa become scarce, treated fence posts are being increasingly used. Most all farms have some common woods growing, practically all of which take coal-tar creosote readily.

Practical exercises.—In a field trip to the farm forests note what care is taken in felling trees, the disposition of limbs and tops, and the height of the stumps. What examples may be found where an expensive wood is used that could be replaced by a cheaper substitute? What high-priced timber is found in the district? What is the common method of treating fence posts? How do telephone and telegraph companies protect their poles? What good and what bad example of the use of farm timber can you mention?
Correlations.—Language: Make a written or an oral report on the methods of cutting and handling timber on the farm with especial reference to disposing of waste timber. Write a short account on the best methods used in the preservation of timber used in posts, railroad ties, and other lumber.

Arithmetic: Measure the height of stumps in a cut-over piece of timber and calculate the amount of lumber wasted. If one hundred 7-foot black walnut fence posts averaging 5 inches square in size can be replaced by 100 locust or red cedar posts of the same size, calculate, on the basis of local prices, the amount saved by the substitution. If creosoting a softwood post costs 15 cents each for treating but will make it last three times as long as one not treated, assuming average present local prices for labor in replacements and cost of untreated posts, what will be saved in 20 years in fencing a quarter section of land with posts spaced 12 feet apart?

Lesson VI. MEASURING AND ESTIMATING TIMBER.

Problem.—How shall timber be measured and estimated?

Sources of information.—Farmers' Bulletin 715; colleges of agriculture or State foresters' publications; rule for scaling logs, page 39.

Topics for study.—Measuring saw logs: Show how the diameter at the small end is found by measuring inside the bark along an average line, or two measurements taken at right angles and the two averaged. The diameter and length found, the approximate lumber contents is found by referring to a copy of some log rule; probably the most common rule in use is the Doyle, although for small logs under 16 to 20 inches one of the least accurate rules, because from one-third to one-half more lumber is usually sawed out than is shown by the rule. (See Supplement, p. 39.)

How bolts and billets are measured. What makes a standard cord of wood?

Allowances made for defects in saw logs, bolts, or blocks, and in other material.

Estimating standing trees: Finding approximately the contents of standing trees in cords or board feet of lumber by measuring the diameter at breast-height (4½ feet above the ground), estimating or measuring the number of 16-foot log cuts in the tree, and by using volume tables given on pages 18, 22, and 23 of Farmers' Bulletin 715. Find the merchantable contents of the tree expressed in board feet.

Estimating whole woods: Applying the same method to all the trees on a measured one-tenth or one-quarter acre, and thereby estimating the contents per acre. Recording the measurements by different species on a simple blank form ruled in squares in two directions.
Practical exercises.—This lesson should be essentially one of practice. The class should measure logs according to the Doyle rule, standing trees by the use of volume tables for trees, and cordwood by dimensions of the piles. A good exercise for the more advanced students is to make estimates on logs and standing trees and then by applying the Doyle rule or the volume table test the accuracy of the estimates. The practical value of this lesson is in acquainting the pupils with comparatively easy ways by which they can measure logs and cordwood and estimate the amount of lumber or cordwood in trees.

Correlations.—The operations mentioned in the practical exercises will afford abundant work in calculations and suggest a varied list of arithmetic problems.

Lesson VII. MARKETING FARM TIMBER.

Problem.—How shall the farm timber be marketed to the best advantage.

Sources of information.—Farmers' Bulletins 715 and 1100; bulletins of the State colleges of agriculture and State foresters.

Illustrative material.—Timber price lists. Addresses of firms dealing in timber. Local prices for cordwood, posts, crossties, and piling.

Topics for study.—Finding the best markets: Before timber is cut its approximate size and amount by species, and its disposal should be determined as definitely as possible. How to find buyers of cut-timber products. How are logs, bolts or billets, piling, posts, crossties, and firewood generally sold? Advertising in the newspapers, consulting neighbors who have recently sold timber, consulting State foresters and reliable experienced men.

The owner protecting himself by a simple form of written contract: Much loss comes to sellers of timber products by failure to
observe this precaution and to have the agreement in proper written form.

Selling timber standing: Selling for a stated sum by the acre, or a lump sum for the whole tract or "boundary."

What to sell and what timber to keep growing in the woods; what timber to sell and what to use at home. Choice logs of certain woods bring high prices, and can be profitably shipped long distances by rail or water.

Cooperative marketing of farm timber: Carload lots of logs, etc., the least amount that can profitably be shipped. Many wood manufacturing concerns buy direct from producers in carload lots. A farmer may not have sufficient white oak saw logs or hickory spoke blocks to pay to ship.

Practical exercises.—What timber is being sold in the district? Who is buying it? To what place is it being shipped? What standing timber is sold in the district? What cooperative shipping of timber do you find? Visit a wood yard and note methods of handling the wood and get prices per cord on the different sizes of wood.

Correlations.—Abundant exercises in arithmetic will be suggested by the prices of timber and amounts sold. If a price list of timber and its products at the final market can be had, some interesting problems can be worked out by comparisons with local prices.

For a language exercise make a report on the various kinds of timber marketed, prices paid, methods of transportation, and markets.
Lesson VII. PROTECTING THE WOODS.

Problem.—To learn the best methods of protecting woodlands, and to discover the kind and extent of injury or loss due to forest fires. Sources of information.—Farmers' Bulletins 173 and 711; Forestry Circular 205: Department Bulletins 308 and 787; Yearbook Separate 548; State publications. The U. S. Department of Agriculture and the agricultural colleges will be glad to render assistance by identifying and furnishing information concerning various forest insects and plants.

Illustrative material.—Pictures of forest fires, burnt over woodlands, forest rangers, their camps and equipment, copies of the United States Forest Regulations, and charts for fire prevention

Fig. 11.—Oak spoke blocks, piling, and crossties ready for shipment.

HELP
PREVENT WOODS FIRES.
BE SURE your match is out before throwing it away.
DON'T throw away burning tobacco.
CHOOSE a safe place and make your camp fire small.
PUT OUT your fire with water and then cover it with earth.
DON'T make large brush heaps. Choose a still day for burning and plow furrows to protect near-by woods.
BE CAREFUL WITH FIRE.
will make excellent illustrative material. Pictures of trees damaged by insects or fungi, samples of damaged wood, samples of insecticides and materials used to prevent insects from damaging trees should also be used.

Topics of study.—Fire, the arch enemy of the forest: It kills large numbers of the smaller trees and kills or weakens the vitality of the older trees; the humus layers over the ground are destroyed. The loss of the protective covering exerts a marked effect in causing the soil to dry out and become hard, as a result of which the rain is shed off rapidly following dry weather, much as when it falls on a house roof. Trees in farm woodlands and city parks are often seen dying at the tops, most usually from this cause.

Forest rangers employed by the States and Government for the administration and protection of the State and National Forests. What type of men are required for forest rangers whose duties require them to live out of doors and ride or work in all kinds of weather? Each National Forest divided into districts in charge of rangers. Fire protective plans worked out in great detail for detecting and fighting fires as soon as possible after they start. Fire-fighting equipment, such as lookout peaks and towers, telephone lines, and fire-fighting tool boxes at convenient points over the forest. Airplane patrol and the wireless telephone are being successfully used.

Protection for State forest lands by similarly organized methods. Federal cooperation with the various States authorized by the Weeks law, for the protecting against fire of headwaters of navigable streams.

The grazing of live stock has much the same effect in removing the protective covering and packing the ground hard. Cattle and horses browse off the tender young seedlings and tramp down the upper soil layers. Sheep and goats are very destructive to young seedlings, particularly when closely herded. Hogs feed upon most kinds of acorns and nuts, although by rooting up the leaf litter they sometimes favorably expose the mineral soil for the quick germination of tree seeds. Hogs are very destructive to the seed or mast of the long-leaf pine, and the young seedlings are killed in large numbers by animals stripping off the thick, sweet, spongy bark from the roots.

Damage by insects: Leaf and inner bark-eating, twig-cutting, bark and woodboring insects. Methods of checking spread of insect infestation by right methods of cutting.

Fungi in forest trees as a source of the dying and injury of many trees. Some trees more immune than others. Importance of keeping woods in a healthy growing condition and rightly cut in order to combat the spread of fungus diseases.
PREVENT FOREST FIRES

Start camp fires only in safe places and extinguish them completely before leaving. Put out any fire discovered or report it to the nearest Forest Officer. The Laws provide heavy penalties for wilful or careless setting of forest fires. A reward will be paid for information leading to conviction of offenders.

Form 986

Fig. 12.—One of the fire signs posted widely in the National Forests.
Practical exercises.—What damages to woodlands occur in the district? What forest protection in use in this locality? Do you find any disease or insect attacking any special group of trees? Are farm animals allowed to graze in the farm woodlands? If so, what damages do you notice?

Lesson IX. IMPROVING THE HOME FOREST BY CUTTING.

Problem.—To study how to improve the home forest by proper cutting.

Sources of information.—Farmers' Bulletins 711, 1071, and 1117; Forestry Bulletins 92 and 96; Department Bulletins 11, 13, 139, and 308; Forestry Misc. R-3; State Foresters' publications.

Illustrative material.—Charts or illustrations showing results of overcrowding and of proper thinning out of forest trees. Pictures showing results of careless felling of trees. If possible, visit a forest where these results can be actually shown by observing rings on stumps or cutting into trees that have been several years previously thinned. In an even-aged group, note different sizes of trees of same age as result of differences in growing space.

Topics for study.—Cutting the individual tree rightly; why as little as possible of the tree's stump and top should be left in the woods; careful felling of trees. What is liable to happen to trees injured by another falling?

Thinning out overcrowded stands of forest trees. How fewer and fewer trees can grow on an acre as the trees increase in size. Available light supply for growth. Purpose of thinning to utilize timber that would otherwise die and go to waste. Also to stimulate the remaining trees to increased growth, which means increased value.

Improve the woods by proper cutting, taking out (1) the mature, (2) broken, crooked, diseased trees, and (3) the slow-growing and less valuable species of trees. Most woodlands have many such trees crowding out young, promising trees of the better kinds. Making woodlands yield a profit on the investment, increasing farm income and the selling value of the farm.

Practical exercises.—The facts taught in this lesson should be verified by actual observation in trips to forests. Study first hand the results mentioned in the lesson. A good project would be the improvement of a forest plat by proper thinning, including the removal of diseased, defective, overcrowded, and dead trees, and undesirable species.

Correlations.—The class in drawing may construct the charts mentioned under "Illustrative material." They should also make drawings of trees showing development under adverse conditions and of others under proper conditions.
Fig 13.—The growth and value of pine are increased by repeated thinning. The trees removed can generally be used or sold profitably for firewood, treated fence posts, or small timber. A, Before thinning. Fifteen overcrowded trees (shaded trees to be cut). B, The same stand five years after thinning. Six larger and more valuable trees (shaded tree to be cut).
Language: A survey of the general practice of home forest improvement of the district with a written report of the same will afford a very good exercise in language.

Geography: A district or county map locating the farm forest areas and designating those under improvement. An outline map of the State locating the farm forest areas.

Lesson X. GROWTH OF TREES AND FORESTS.

Problem.—To learn how trees and forests grow.

Sources of information.—Farmers' Bulletins 134, 173, and 1071; Forestry Bulletin 92; Department Bulletin 308.

Illustrative material.—Potted seedlings, pots or boxes, and seeds of trees. A chart showing roots, stem, and leaves of a tree. A chart, or better, an actual cross section of a tree stem showing different parts of the stem, such as annual rings, heartwood, sapwood, bark, and cambium. Leaves mounted so that their structure can be studied. Branches showing bud and twig arrangement. Drawings showing shapes of crowns of trees grown in the open and grown in close stands.

Topics for study.—The life of a tree and why it is necessary to know something about how trees live.

The leaves, trunk, and roots, and function of each in the tree's existence. How the tree breathes and gets its food from the soil and air; what travels upward and what downward in the branches and stems. Structure of the leaf and different parts of the trunk.

How the branches lengthen and the tree trunk increases in size; the location, color, and structure of the living tissue or cambium layer. What are annual rings, heartwood, and sapwood?

Requirements for growth: Air, light, moisture, and heat.

Trees in association—a stand. Influence of trees upon each other. Difference, if any, between shape of crowns of open-grown trees and those grown in close stands. Influence of different light and soil moisture supply.

Effect of tree density (number of trees in a given area) upon growth of the individual tree. Natural dying out of trees in close stands with advancing age. Understocked, well-stocked, and overstocked stands and the production of (a) saw timber, and (b) cordwood per acre under each condition.

Practical exercises.—Make the following tests to show requirements for growth. Place a potted forest tree seedling in the dark for a few days; withdraw moisture from one and supply moderate amounts of moisture and excess moisture to other seedlings; subject plants, if possible, to different degrees of heat. Note results. Erect a pole or 1 by 2 inch timber strip close beside a young, thrifty
sapling pine or hardwood. At regular intervals of a week or month, mark on it the total height of the growing tree. Keep a record also of the dates and measured heights.

Fig. 14.—How the tree trunk grows. All growth takes place in the cambium, lying between the inner bark and sapwood. This is a very thin layer of living cells which divide and subdivide, forming on the outside bark and on the inside wood (A). The inner bark, or last tissue, is soft and moist. Its function is to carry the food prepared in the leaves to all growing parts of the tree (B). By a gradual change the inner bark passes into outer bark, a corky layer composed of dry, dead leaves. This serves to protect the living stem against evaporation and mechanical injury (C). The woody growth during one season is called an annual ring. In the spring the newly formed cells are thin-walled and spongy, while in midsummer and fall the walls of the cells become thicker and denser. This difference can be distinguished in many kinds of trees as light colored spring wood and darker colored summer wood. Sapwood (D) is the lighter colored band of wood beneath the bark, often from 1 to 2 inches thick. It carries the sap from the roots to the leaves. Heartwood (E) is formed by a gradual change in the sapwood by which it becomes darker, heavier, and often more lasting. Most of the trees, but not all, form heartwood. Pith is the soft tissue on the innermost part of the stem, about which the first woody growth takes place in the newly formed twig (F). From it extend the pith rays (G). These flat bands of the same tissue connect the pith with the various layers of wood and the bark. They transfer and store up food.

Lesson XI. FOREST REPRODUCTION.

Problem.—To learn how trees reproduce themselves.

Sources of information.—Farmers’ Bulletins 134, 173, 423, 711, 788, 1071, and 1123; Forestry Bulletins 45, 121, and 244. Forestry
Circulars 45, 81, 99, and 208; Department Bulletin 153; Department Circular 8.

Illustrative material.—Make a collection of seed specimens of the classes indicated under "Topics for study." Either mount these seeds on cardboard or put them in wide-mouth bottles. Clip pictures of young forest growth.

Topics for study.—Seeds: The various devices of nature for dispersing the seed widely. Tree fruits with (a) wings, plumes, etc., (b) pulpy fruit with bony seeds sought by birds, (c) rich nut kernels liked by rodents and birds, and often buried or otherwise stored away, (d) light seeds which float or roll along the bottom of streams. Species of trees whose seeds are (a) carried by wind, (b) water, or by (c) birds and animals. (Fig. 16.)

Sprouts: Different species of trees which reproduce themselves by means of sprouts from stumps. From what part or parts of the stump do sprouts arise? Species which sprout from surface or lateral roots. Influence of the season of the year when cutting is done upon the vigor and growth of sprouts. Influence of age of parent tree upon success of sprouting.

Natural forest reproduction: Young growth. (Fig. 17.) Conditions under which young growth starts in woodlands. A forest
By wind.

Fig. 16.—How the forest travels: By wind.
Fig. 16.—How the forest travels: By animals; by birds; by water.
without young growth is like a community without children—it will die out. Need for large numbers of young trees for perpetuation of the forest. Competition and shading out of the weaker seedlings and saplings.

How the forest travels: 
(a) By wind; 
(b) by animals, birds, and water. (Fig. 16.)

Age groups of young growth: 
(a) Seedling, 
(b) small sapling, 
(c) large sapling, 
(d) small pole.

Fig. 17.—Woods with plenty of young growth coming on to take the place of the larger trees when cut.

Starting a young forest by direct seeding or transplanting nursery grown seedlings. Sowing the seed direct where the trees are wanted. Kinds of trees started this way: Usually the species difficult to transplant on account of large, deep taproots, such as hickories, walnuts, some of the oaks, longleaf and some other pines. Collecting the seed. Storing the seed over winter. Sections of the country (north) where seed sowing is best done in the spring and (south) where it may also be done in the fall or early winter. Preparation of the soil and method of planting seed of different kinds. Care of growing seedlings.
Planting seedlings grown in nursery beds. Preparation of nursery beds and sowing of seeds. Kinds of trees commonly raised in nursery beds. Age of seedlings fit for planting. Need for transplanting seedlings in nursery prior to planting out in the woods or fields. Season of year for successful planting and method of planting. Sources of injury or loss, and means of combating. (Fig. 18.)

Regions where forest plantations are needed and commonly started. Purposes for which plantations are set out. Kinds of trees profitable in plantations. Pure and mixed plantations, and advantages of each.

Fig. 18.—Forest plantations are made with small seedlings and no later watering or cultivation are necessary. Fire and grazing stock must be excluded.

Planting steep slopes and eroding soils with forest trees to check soil wastage and land destruction. Kinds of trees suitable for taking hold quickly and multiplying on such dry banks.

Filling up large openings in the woods and improving existing woodlands by planting desirable species of trees.

Utilizing poor soils and so-called waste places about the farm by planting quick-growing, useful kinds of trees: Black locust for fence posts, pine and other species for use as treated fence posts.

Trees about the farm and farmstead for shade, nut production, and ornamental purposes.
Lesson XII. WOODLANDS AND FARM MANAGEMENT.

Problem.—How may the home forest be best managed to make it more valuable, to increase the farm income, and to make the farm more desirable.

Sources of information.—Farmers' Bulletins 635, 711, 715, 745, 1071, and 1117; Department Bulletin 451.

Topics for study.—Review importance and value of woodlands to the farm. The uses of timber on the farm, and importance of having home-grown timber close at hand.

Increasing the farm income by marketing the choice grades of logs and other rough wood products not needed for home use.

Woodlands making farms more desirable and saleable than similar farms without timber. The actual value of the timber and the additional indirect or aesthetic value because of attractiveness, a place for the owner to recreate in, or a cover for small game. People have an inherent fondness for the woods. How the occurrence of woods makes the community a better one in which to live.

Increasing or reducing the area in woods to the point of right proportion of cropland, pastureland, and woodland. The soundness of the farm policy of having permanent woodland on the farm. Proper area in permanent woodland. Kind of soil, topography, and amount of forest land in the locality, and their effect in determining the area of permanent woodland.

Waste or idle land, poor soils, steep slopes, wastes and gullies, rocky and wet lands (fig. 19) made profitable by growing timber.

Handling woodlands so as to keep them at the highest point of production. Overcutting and its ill effect upon the productive power of the forest. Owners to be satisfied with a permanent revenue from the woodland. Difference between a mine and a forest in respect to their producing power.

Woodlands as a source of permanent revenue on the farm. Differences between a timber tract containing thrifty young trees and one with only scattered old trees and much sod and shrubs. The forest capital—the stock of growing trees—must not be too heavily cut. Because of the desire for ready money, there is constant danger of this happening. The apparent returns may be increased for a few years, while the productive capacity of the forest is being reduced below the minimum limit. This point, below which the total amount of growing timber should not be allowed to fall, is about one-half the contents of a fully stocked stand at maturity. If the latter, for example, is 40 cords per acre, then the woods should never contain less than about 20 cords per acre as the growing stock or basis necessary to secure the maximum production. This does not apply to mixed hardwoods cut clean and renewed by sprouting.
Effect of the general rise in the value of all timber products in its relation upon desirability of holding woodlands and keeping them productive. How a forest tract may supply timber yearly for many years and meanwhile increase in value and be worth more at the end of a long period.

Growing timber as a bank account upon which the owners may draw repeatedly without diminishing the capital. A good form of property to be handed down to the children as an inheritance.

Keeping fire out of the woods, cutting the trees carefully, and finding the best markets for excess timber products not needed on the farm are indications of sound judgment in farm management.

Practical exercises.—A survey of the methods of caring for the farm forest should be made. This survey should inquire into the general practice of the district in the care of the forest, the forest products marketed, the utilization of waste or idle lands for forest tracts, the practice of replanting forest plats, and the general relation of the acreage in forest to the crop and pasture acreage. From this survey many facts will be obtained for class discussion in forest management. A field trip into some of the farm woodlands of the district is desirable where the studies made first-hand should include the farm practice on the care of the forest.

Fig. 19.—Rough, steep, and poor lands and inaccessible parts of the farm increasing farm income by growing trees in permanent woodlands.
SUPPLEMENT.

PUBLICATIONS OF THE UNITED STATES DEPARTMENT OF AGRICULTURE RELATING TO FORESTRY ON FARM WOODLANDS.

DIRECTIONS FOR REQUESTING THESE PUBLICATIONS.

(a) For publications available for free distribution, application should be made to the Chief of Publications, U. S. Department of Agriculture, Washington, D. C.  
(b) For publications for sale, application should be made to the Superintendent of Documents, Government Printing Office, Washington, D. C., inclosing the money in the form of cash or money order (stamps not accepted).

The following lists are subject to frequent changes as available supplies become exhausted and new publications are added.

FARMERS' BULLETINS AVAILABLE FOR FREE DISTRIBUTION.

173. Primer of Forestry, Part I.
358. Primer of Forestry, Part II.
468. Forestry in Nature Study.
516. Production of Maple Sugar and Sirup.
622. Basket Willow Culture.
635. What the Farm Contributes Directly to the Farmer's Living.
711. Care and Improvement of Farm Woods.
715. Measuring and Marketing Farm Timber.
744. Preservative Treatment of Farm Timbers.
745. Waste Land and Wasted Land on Farms.
788. The Windbreak as a Farm Asset.
888. Advice to Forest Planters in the Plains Region.
1023. Machinery for Cutting Firewood.
1071. Making Woodlands Profitable in the Southern States.
1100. Cooperative Marketing of Woodland Products.
1117. Forestry and Farm Income.
1123. Growing and Planting Hardwood Seedlings on the Farm.

OTHER DEPARTMENT PUBLICATIONS AVAILABLE FOR FREE DISTRIBUTION.

Forestry Bulletin 111, Lightning in Relation to Forest Fires.
Forestry Bulletin 114, Forestry Conditions in Louisiana.
Department Bulletin 55, The Balsam Fir.
Department Bulletin 152, The Eastern Hemlock.
Department Bulletin 153, Forest Planting in the Eastern United States.

Department Bulletin 638, Forestry and Community Development. Price, 10 cents.

STATE FORESTRY DEPARTMENTS.

Thirty-three States have Departments of Forestry, all of which publish more or less material on varied phases of the subject. Applications should be addressed to the State Foresters at the following places:

Alabama, State Commission of Forestry, Montgomery.
California, State Board of Forestry, Sacramento.
Colorado, State Board of Forestry, Fort Collins.
Connecticut, State Forester (under Agricultural Experiment Station), New Haven.
Idaho, Fire Warden System (under State Board of Land Commissioners), Boise.
Illinois, State Forester, Urbana.
Indiana, State Board of Forestry, Indianapolis.
Iowa, State Forestry Commissioner, Des Moines.
Kansas, State Agricultural College, Manhattan.
Kentucky, Commissioner of Agriculture, Frankfort.
Louisiana, Department of Conservation, New Orleans.
Maine, Forest Commissioner, Augusta.
Maryland, State Board of Forestry, Baltimore.
Massachusetts, State Forester, Boston.
Minnesota, State Forestry Board, St. Paul.
Montana, State Board of Land Commissioners, Helena.
New Jersey, Department of Conservation and Development, Trenton.
New York, Division of Lands and Forests, Albany.
North Carolina, Geological and Economic Survey, Chapel Hill.
Ohio, Department of Forestry, Wooster.
## Doyle Rule for Scaling Logs

To find the number of board feet in a log without using the table above according to the Doyle rule: Deduct 4 inches from the diameter of the smaller end, square one-fourth the remainder, and multiply the product by the length in feet.

<table>
<thead>
<tr>
<th>Diameter of log (small end, inside bark)</th>
<th>LENGTH OF LOG IN FEET</th>
<th>BOARD FEET</th>
</tr>
</thead>

For information regarding the advisability of using different log scales see U. S. Dept. Agr., Farmers’ Bul. 715.
KEY TO COMMON KINDS OF TREES.

The following key is intended only as a guide in the identification of the more common kinds of trees. It is based on prominent, distinctive characteristics which can readily be observed by those who have no special training in botany. Most of the terms used require no explanation.

To use the key, decide first, by an examination of the leaf, in which of the following seven sections your tree belongs; then turn to that section, and from the descriptions there given determine what kind of tree it is.

Section.

Trees with needles or scale-like leaves, mostly evergreens, bearing cones.  I

Trees with broad leaves:

Leaves simple—

Alternately attached edges—

With toothed edges. ................................................ II

Edges neither toothed nor notched................................ III

Opposite on twigs—

With toothed edges ............................................ IV

Edges neither toothed nor notched............................... V

Leaves compound—

Alternately attached to twigs.................................. VI

Opposite on twigs.................................................. VII

THE CONIFEROUS 2 TREES.

I. TREES WITH NEEDLES OR SCALE-LIKE LEAVES, MOSTLY EVERGREEN, BEARING CONES.

A. Leaves needle-shaped:

(1) Leaves clustered—

(a) Leaves long, from 1 to 18 inches, 2 to 5 in a cluster. Cones large, with many thick, woody scales. (Pinus) Pine.

(b) Leaves short (less than 2 inches long) in brush-like clusters of 12 to 40; falling off in winter. Cones very small, with thin scales; remaining on tree for one or more seasons. (Larix) Larch.

(2) Leaves single—

(a) Leaves scattered around twigs; falling off when dry or dead. Cones elongated, with thin scales. Twigs roughened by leaf-scars.

(x) Leaves stiff, often sharp-pointed and more or less four-sided. (Picea) Spruce.

(y) Leaves soft, flat, rounded, or notched at ends, the bases abruptly contracted into thread-like stems. (Tsuga) Hemlock.

(b) Leaves in two distinct rows, one on each side of the twig; falling off in late autumn or winter. Cones small, ball-like. (Taxodium) Bald cypress.

1 This key and the following tree descriptions are by William H. Lamb, Scientific Assistant in Dendrology, Forest Service.

2 Cone-bearing.

3 The larches are peculiar in having single, scattered leaves on the new or terminal twigs produced each season. These should not be mistaken for the "single" leaves borne throughout by other kinds of evergreens.
A. Leaves needle-shaped—Continued.
(2) Leaves single—Continued.
(c) Leaves often in two rows on the tops and sides of the twigs; leaves on lower branches mostly flat, those on upper branches stouter. Cones long, erect, forming only on upper side of topmost branches; the scales falling off in autumn, leaving spike-like central axes of the cones attached. (Abies) Fir.
B. Leaves scale-like, pointed, overlapping closely on flat or four-sided twigs.
(1) Twigs four-sided. Cones round or ball-like, with small, thick scales; seed with very narrow, hard wings. (Cupressus) Cypress.
(2) Twigs flattened.
(a) Cones elongated, with only a few thin scales; bent back on branches. (Thuja) Arborvitea.
(b) Cones round, very small, berry-like with thin scales; seeds with a broad, thin wing on two sides. (Chamaecyparis) Cedar.
(c) Cones berry-like (showing no separation into scaly parts), Leaves either short, scale-like, and sharp-jointed, or much longer, needle-like, standing out loosely, and attached in pairs or in threes on the twigs. (Juniperus) Juniper.

THE BROADLEAF TREES.

II. LEAVES SIMPLE, ALTERNATE, WITH TOOTHED EDGES.

A. Leaves deeply lobed, or with large notches.
(1) Leaves as wide as they are long. Fruit, a swinging ball, 1 to 1½ inches in diameter.
(a) Leaves with finely toothed margins; star-shaped, the divisions pointed. Fruit, bur-like balls, from which, when ripe, small, winged seeds may be shaken. Bark rough. (Liquidambar) Sweet gum.
(b) Leaves with smooth margins, 3 to 5 inches long, pointed lobes, the space between the lobes rounded. Fruit, a rough ball, easily broken when ripe; composed of closely packed, long, narrow seeds which have hair-like bristles at their lower ends and are attached to a bullet-like central part. Old bark of trunks and large limbs peeling off in thin, curled pieces, leaving pale inner bark showing in irregular patches. (Platanus) Sycamore.

(2) Leaves longer than wide.
(a) Leaves large, with deep, round-topped, or pointed lobes. Fruit, an acorn, resting in a separable cup. (Quercus) Oak.
(b) Leaves small, with little, sharp teeth on margin. Twigs bearing sharp teeth. Fruit small (like a little apple), round, with bony seeds (hard core). (Crataegus) Hawthorn.

B. Leaves one-sided (one side of leaf shorter at base than the other side).
(1) Leaves large, oval, 5 to 10 inches long, heart-shaped. Fruit, a cluster of small, woody balls ½ to ¾ inch in diameter, hanging from a narrow, leaf-like blade. (Tilia) Basswood.
B. Leaves one-sided—Continued.

(2) Leaves 3-veined at base, with long, tapering points, which generally turn to one side; edges smooth, or with small teeth of uniform size. Fruit, a small berry about ½ inch in diameter. (Celtis) Hackberry.

(3) Leaves with straight veins, oval; edges double-toothed (little teeth on the larger ones). Fruit in clusters, dry, flat, with papery wings all around the seeds. (Ulmus) Elm.

C. Leaves even sided (both sides of leaf the same length).

(1) Leaves oval, evergreen thick, with short needle-like teeth. Fruit, a bright red berry. (Ilex) Holly.

(2) Leaves more or less elongated, with one tooth at the end of each side vein.

(a) Trees with smooth, bluish-gray bark, and long, pointed chestnut-brown buds. Fruit, a small, three-cornered nut, in a spiny husk which splits open at the top into three parts. (Fagus) Beech.

(b) Trees with ridged, grayish-brown bark. Fruit, a large round nut in a thick husk covered with dense, needle-like spines; the husk splits open from the top into 3 or 4 divisions. (Castanea) Chestnut.

(3) Leaves very narrow, finely toothed. Small branches slender, usually tough. Fruit, a long cluster of little pods filled with "cotton." (Salix) Willow.

(5) Leaves oval, pointed, with saw-like teeth.

(a) Fruit like a tiny pine cone.

(x) Bark of trunk and branches peeling off in thin sheets. Leaves double-toothed (little teeth on the larger ones.) Fruit ("cones") scaly, falling apart when ripe; seeds with gauze-like wings on two sides. (Betula) Birch.

(y) Bark smooth or broken, but not peeling. Leaves with small teeth. "Cones" hard, woody, not falling apart; seed with narrow wings on two sides. (Alnus) Alder.

(b) Fruit, a berry; fleshy, edible.

(x) Leaves large, 3-veined at base, often irregularly, deeply lobed; containing milky juice. Fruit similar in appearance to a blackberry. (Morus) Mulberry.

(y) Leaves small or medium-sized, feather-veined; containing green juice; fruit (cherry or plum) with one seed.

(i) Seed ("stone") flattened. Fruit large and short-stemmed. (Prunus) Plum.

(ii) Seed round. Fruit small and long-stemmed. (Prunus) Cherry.
III. LEAVES SIMPLE, ALTERNATE, EDGE NEITHER TOOTHED NOR NOTCHED.

A. LEAVES WITH DEEP LOBES.

(1) LEAVES WITH BLUNT ENDS (APPEARING AS IF CUT OFF), AND WITH TWO, POINTED, SIDE LOBES. FLOWERS TULIP-LIKE. FRUIT CONE-LIKE, POINTED, UPRIGHT, COMPOSED OF LONG, THIN, OVERLAPPING, WINGED SEEDS. BRUISED TWIGS HAVE A PEPPEY ODOR. (LIRIODENDRON) TULIP POPlar.

(2) LEAVES WITH Rounded ENDS; OVAL, OFten WITH A LOBE ON ONE SIDE, MAKING THE LEAF MITTEN-SHAPED. BRUISED TWIGS AND INNER BARK OF TRUNK SWEET-SMELLING. (SASSAFRAS) SASSAFRAS.

B. LEAVES WITHOUT LOBES.

(1) BRUISED TWIGS WITH PEPPEY ODOR.

(a) LEAVES OVAL (EVERGREEN IN ONE SPECIES) OR ELONGATED, POINTED, LARGE. FLOWERS LARGE, AT ENDS OF BRANCHES. FRUIT CONE-LIKE, WITH A BRIGHT RED SEED IN EACH DIVISION. (MAGNOLIA) MAGNOLIA.

(2) BRUISED TWIGS WITHOUT PEPPEY ODOR.

(a) LEAVES BROADER AT TOP THAN AT THE BASE, 8 TO 12 INCHES LONG, WITH VERY SHORT LEAFSTALK. FRUIT FLESHY, ELONGATED, 3 TO 4 INCHES LONG, WITH THICK, BROWN SKIN WHEN RIPE, AND LARGE, BONY, FLAT SEEDS. BUDS BROWN AND HAIRY.

(Asamina) Papaw.

(b) LEAVES BROADEST AT MIDDLE, OVAL, 8 TO 10 INCHES LONG.

(x) FRUIT SHORT-STALKED, ROUND, 1 TO 1½ INCHES IN DIAMETER; WHEN RIPE PALE ORANGE COLOR, SURROUNDED AT BASE WITH OLD FLOWER-CUP; VERY BITTER, BUT EDIBLE AFTER FROST.

(Diospyros) Persimmon.

(y) FRUIT LONG-STALKED, ELONGATED OR ROUND, SOLITARY OR IN PAIRS, WITH THIN FLESH AND A RIGID STONE OR SEED. (Nyssa) GUM.

(c) LEAVES ROUNDED OR HEART-SHAPED, 3 TO 5 INCHES ACROSS. FLOWERS PEA-LIKE, PINK, APPEARING BEFORE THE LEAVES. FRUIT, A DRY FLAT POD, 2½ TO 3½ INCHES LONG; IN DENSE CLUSTERS ON SIDES OF BRANCHES; SEEDS, HARD, SMALL, OBLONG, ½ INCH LONG. (Cercis) Red bud.

(3) BRUISED OR CUT TWIGS AND LEAVES WITH MILKY JUICE.

(a) LEAVES WITH NARROW POINTS. TWIGS BEARING THORNS. FRUIT, A LARGE, ORANGE-LIKE, ROUGH BALL, 4 TO 6 INCHES IN DIAMETER. (Toxylon) Osage orange.

IV. LEAVES SIMPLE, OPPOSITE, WITH TOOTHED EDGES.

A. LEAVES WITH LARGE (OFTEN LOBE-LIKE) TEETH. FRUIT IN PAIRS, EACH PART WITH A CONSPICUOUS, FLAT, VERY THIN WING. FRUIT MATURES IN SPRING OR IN AUTUMN, WHEN IT BECOMES DRY AND YELLOWISH-BROWN. (Acer) Maple.

V. LEAVES SIMPLE, OPPOSITE, EDGES NEITHER TOOTHED NOR NOTCHED.

A. LEAVES VERY LARGE, HEART-SHAPED. FLOWERS SHOWY, TRUMPET-LIKE, IN LARGE CLUSTERS. FRUIT, A LONG, CYLINDRICAL POD, 6 TO 14 INCHES LONG, CONTAINING CLOSELY PACKED, FLAT, DRY SEEDS, WITH FRINGED WINGS AT EACH END.

(Catalpa) Catalpa.

B. LEAVES RATHER SMALL, OVAL, TAPERING AT BASE AND POINT. FLOWERS CONSPICUOUS, WHITE (OCCASIONALLY ROSY), APPEARING WITH THE EXPANDING LEAVES. FRUIT, A SMALL CLUSTER OF TWO-SEEDED BERRIES, TURNING RED IN AUTUMN.

(Cornus) Dogwood.
VI. Leaves Compound, Alternately Attached to Twigs.

A. Leaflets small, many, attached along two sides of a main stem. Fruit, a flat, bean-like, dry or fleshy pod.

(1) Leaflets with small, wavy teeth. Pods flat, broad, long, often twisted, thin-skinned, with thick, cheesy, sweetish pulp about seeds. Trees with long, keen, branched thorns. (Gleditsia) Honey locust.

(2) Leaflets not toothed.

(a) Twigs with pairs of short, keen thorns. Leaflets rounded at ends. Flowers showy white, in large clusters. Pods small, flat, thin, dry, with small seeds. (Robinia) Black locust.

(b) Twigs thornless. Leaflets oval, pointed. Flowers greenish, with violet odor. Pods large, flat, thick, with jelly-like pulp (poisonous) around the large, black-brown seeds. (Gymnocladus) Coffee tree.

B. Leaflets large. Fruit, a hard-shelled nut, with a separable husk.

(1) Leaflets narrow at base becoming larger at outer end. But light-colored, in a husk which separates more or less completely into four parts when ripe. (Hicoria) Hickory.

(2) Leaflets broad at base, becoming narrower at outer end. Nut dark, rough, in a fleshy husk which is inseparable by any natural divisions and turns black when old. Pith of twigs forms numerous cross-partitions. (Juglans) Walnut.

VII. Leaves Compound, Opposite on Twigs.

A. Leaflets arranged along two sides of a main leafstalk, with a leaflet at the end.

(1) Leaflets generally 3 (sometimes 5), toothed only near the ends. Fruit, a cluster of dry, winged seeds, arranged in pairs like those of maple. (Acer) Boxelder.

(2) Leaflets generally more than 3 (3 to 11), and either not toothed or with small teeth. Fruit, a cluster of a single-winged, dry, oar-shaped "seeds". (Fraxinus) Ash.

B. Leaflets (5 to 9) clustered at end of a main leaf-stem. Fruit, a shiny, brown nut in a thick, warty or prickly husk, which separates into several parts. (Esenus) Buckeye.

<tbody>
<tr>
<td>1. White pine (Pinus strobus)</td>
<td>Northeastern and Lake States and Appalachian Mountains</td>
<td>Fine timber tree; leaves in clusters of 5, 3 to 5 inches long.</td>
</tr>
<tr>
<td>2. Jack pine (Pinus banksiana)</td>
<td>Northern tree, best growth north of Lake Superior.</td>
<td>Common on sandy soil; leaves in clusters of 2, 1 to 1 1/2 inches long.</td>
</tr>
<tr>
<td>3. Red or Norway pine (Pinus resinosa)</td>
<td>Northern tree, associated with white pine.</td>
<td>Leaves in clusters of 2, 3 to 6 inches long.</td>
</tr>
<tr>
<td>5. Loblolly pine (Pinus taeda)</td>
<td>Southeastern States, Coastal plain, Delaware to Texas.</td>
<td>Leaves in clusters of 3, 6 to 9 inches long.</td>
</tr>
<tr>
<td>6. Shortleaf pine (Pinus echinata)</td>
<td>Middle Atlantic and Southern States, with hardwood trees. Piedmont uplands, New Jersey to Texas.</td>
<td>Leaves in clusters of 2 and sometimes 3, 3 to 5 inches long. Cone small, 1 to 2 inches in diameter.</td>
</tr>
</tbody>
</table>

---

4 Boxelder, a true maple, differs from the others in having compound leaves.
5 Eastern half of United States. Most of these are important as commercial timber trees; a few, however, are small sized and included because of their botanical importance and wide occurrence in mixture with timber trees, particularly in second-growth forests.
6 Some species are known by more than one scientific name because of lack of agreement among botanists. The first name given is to be preferred.

<tbody>
<tr>
<td>7. Spruce pine (Pinus glabra)</td>
<td>Southeastern States along coast</td>
<td>Leaves in clusters of 2, 1½ to 3 inches long.</td>
</tr>
<tr>
<td>8. Scrub pine, Jersey pine (Pinus virginiana)</td>
<td>Middle Atlantic States</td>
<td>Leaves in clusters of 2, 1½ to 3 inches long.</td>
</tr>
<tr>
<td>9. Pond pine (Pinus serotina)</td>
<td>Southeastern States in Coastal Plain. Scattering.</td>
<td>Leaves 6 to 8 inches long, tree similar to pitch pine, but cones remain closed for several years. Cone rounded.</td>
</tr>
<tr>
<td>10. Slash pine (Cuban pine) (Pinus elliottii)</td>
<td>Southeastern States in poorly drained soils; uplands in Georgia, associated with longleaf pine.</td>
<td>South Atlantic and Gulf States.</td>
</tr>
<tr>
<td>12. Tamarack or Larch (Larix laricina, Larix americana)</td>
<td>Northeastern States and in northern Rocky Mountains.</td>
<td>Northeastern States.</td>
</tr>
<tr>
<td>15. Red spruce (Picea rubra)</td>
<td>Northeastern States to southwest Virginia.</td>
<td>Leaves ½ to 1 inch long, attached by tiny leaf-stalks; cones ½ to ¾ inch long.</td>
</tr>
<tr>
<td>16. Hemlock (Tsuga canadensis)</td>
<td>Swamps of eastern and Gulf Coast.</td>
<td>Similar to white spruce, but twigs are minutely hairy.</td>
</tr>
<tr>
<td>17. Bald cypress (Southern cypress) (Taxodium distichum)</td>
<td>Eastern United States.</td>
<td>Similar to black spruce, but cones remain attached to twigs when ripe.</td>
</tr>
<tr>
<td>18. Balsam fir (Abies balsamea)</td>
<td>Southeastern States to northern Appalachian Mountains.</td>
<td>Leaves ½ to 1 inch long, attached by tiny leaf-stalks; cones ½ to ¾ inch long.</td>

<tr>
<td>20. Arborvitae (Thuja occidentalis)</td>
<td>Northeastern States.</td>
<td>Leaves scale-like; cones ½ to 1 inch long, bent backward on twigs.</td>
</tr>
<tr>
<td>22. Red cedar or juniper (Juniperus virginiana)</td>
<td>Eastern United States.</td>
<td>Leaves scale-like, those on young shoots and seedlings awl-shaped; cones changed into a soft berry.</td>
</tr>
<tr>
<td>23. Sweet gum (Red gum) (Liquidambar styraciflua)</td>
<td>Southeastern States.</td>
<td>Leaves star-shape, fruit a bur-like ball suspended by a long stalk.</td>
</tr>
<tr>
<td>24. Sycamore of Buttonwood (Platanus occidentalis)</td>
<td>Eastern United States.</td>
<td>Leaves broad and coarsely toothed; base of leafstalk inclining winter bud in peculiar manner; fruit a hard surfaced, long-stalked ball.</td>
</tr>
<tr>
<td>25. White oak (Quercus alba)</td>
<td>Northern United States, Wyoming.</td>
<td>Leaves deeply lobed, not bristle-tipped; acorns ripening in one season.</td>
</tr>
<tr>
<td>26. Bur oak (Quercus macrocarpa)</td>
<td>Southeastern United States.</td>
<td>A white oak with acorns completely or almost covered by the acorn cup.</td>
</tr>
<tr>
<td>27. Overcup oak (Quercus lyrata)</td>
<td>Eastern United States.</td>
<td>A white oak with leaves cut deeply above and below the middle lobes, forming the suggestion of a cone.</td>
</tr>
<tr>
<td>28. Post oak (Box oak) (Quercus minor)</td>
<td>Northeastern States and Appalachian Mountains.</td>
<td>A white oak with leaves resembling those of the chestnut.</td>
</tr>
<tr>
<td>29. Chestnut oak (Quercus prinus)</td>
<td>Eastern United States.</td>
<td>Leaves deeply cut, with bristle-tipped points; acorns ripening in 2 seasons, with acorn cups very shallow.</td>
</tr>
<tr>
<td>30. Red oak (Quercus rubra)</td>
<td>Central and Southeastern States.</td>
<td>A red oak with thicker leaves which are minutely woolly beneath; acorns with cups as deep or deeper than wide.</td>
</tr>
<tr>
<td>31. Black oak (Quercus velutina)</td>
<td>Southeastern United States.</td>
<td>A red oak with leaves very deeply cut, the upper central portion being very narrow and sometimes slightly curved. Abundant.</td>
</tr>
<tr>
<td>32. Pin oak (Quercus palustris)</td>
<td>Eastern United States.</td>
<td>Leaves not toothed, with large terminal lobes, sometimes 3-lobed. Acorns with shallow cup. Much planted as street tree throughout South.</td>
</tr>
<tr>
<td>33. Southern Red or Spanish Oak (Quercus dalea, Quercus falcata)</td>
<td>Central and Southeastern States.</td>
<td>A red oak with leaves not toothed nor lobed; resembling a smooth-edged willow or peach leaf. Much planted as street shade tree in Southern States.</td>
</tr>
<tr>
<td>34. Water oak (Quercus nigra)</td>
<td>Southeastern United States.</td>
<td>An evergreen oak with leaves not toothed nor notched; acorns with long stalks.</td>
</tr>
<tr>
<td>35. Willow oak (Quercus phellos)</td>
<td>Eastern United States.</td>
<td>An evergreen oak with leaves not toothed nor notched; acorns with long stalks.</td>
</tr>
<tr>
<td>36. Live oak (Quercus virginiana)</td>
<td>Southern States.</td>
<td>An evergreen oak with leaves not toothed nor notched; acorns with long stalks.</td>
</tr>
<tr>

<tr>
<td>------</td>
<td>--------------</td>
<td>---------</td>
</tr>
<tr>
<td>37. Basswood or Linden (Tilia americana)</td>
<td>Eastern United States</td>
<td>Leaves broadly heart-shaped with finely toothed edge; fruit a cluster of little woody balls suspended from the middle of a long narrow leaf.</td>
</tr>
<tr>
<td>38. White basswood (Tilia heterophylla)</td>
<td>Middle and South Atlantic States</td>
<td>Similar to basswood excepting that the leaves are whitish or minutely woolly beneath.</td>
</tr>
<tr>
<td>39. Hackberry (Sugarcane) (Celtis occidentalis)</td>
<td>Eastern United States and west to New Mexico and Oregon</td>
<td>Leaves finely toothed; long pointed; fruit a long stalked, single-seeded berry with very thin flesh.</td>
</tr>
<tr>
<td>40. White elm (Ulmus americana)</td>
<td>Eastern United States</td>
<td>Leaves sharply toothed; fruit flat, papery, about ¼ inch long; fringed around with tiny hairs.</td>
</tr>
<tr>
<td>41. Slippery elm (Ulmus fulva, Ulmus pubescens)</td>
<td>do</td>
<td>Similar to white elm, but inner bark is slippery and the flat fruits have a smooth edge.</td>
</tr>
<tr>
<td>42. Cork elm (Ulmus racemosa)</td>
<td>do</td>
<td>Evergreen tree with leaves large spiny teeth, and fruit a bright red berry, remaining attached through the winter. Small tree.</td>
</tr>
<tr>
<td>43. Holly (Ilex opaca)</td>
<td>do</td>
<td>Leaves with saw-tooth edge; fruit a light brown nut, ripening and falling from spine covered hull in late summer.</td>
</tr>
<tr>
<td>44. Beech (Fagus americana), Fagus aropalineus</td>
<td>do</td>
<td>Leaves with sharp, forward pointing teeth; fruit, a cluster of nuts surrounded with a very spiny hull. A plant disease is rapidly killing chestnut timber.</td>
</tr>
<tr>
<td>45. Chestnut (Castanea dentata)</td>
<td>Northeastern and middle Atlantic States</td>
<td>Leaves smaller than chestnut and finely woolly beneath; but one nut in the spiny husk. Mostly known as a shrub but reaches tree size.</td>
</tr>
<tr>
<td>46. Chinquapin (Castanea pumila)</td>
<td>Middle and Southern States</td>
<td>Leaves slender, long pointed, and finely toothed. The largest of our willows, difficult to distinguish from dozens of other kinds of willow.</td>
</tr>
<tr>
<td>47. Black willow (Salix nigra)</td>
<td>Eastern United States</td>
<td>Leaves very broad at base, toothed, with round leafstalk.</td>
</tr>
<tr>
<td>48. Balm of Gilead (Balsam poplar) (Populus balsamifera)</td>
<td>Northern United States</td>
<td>Leaves resembling Balm of Gilead, but with flattened leafstalk.</td>
</tr>
<tr>
<td>49. Cottonwood (Carolina poplar) (Populus deltoides)</td>
<td>Eastern United States</td>
<td>Leaves with round leafstalk minutely woolly on underside when young.</td>
</tr>
<tr>
<td>50. Swamp cottonwood (Populus heterophylla)</td>
<td>South Atlantic and Gulf States, Northern and Western United States</td>
<td>Leaves broad, finely toothed, leafstalks flat, longer than blades.</td>
</tr>
<tr>
<td>51. Aspen (&quot;popple&quot;) (Populus tremuloides)</td>
<td>Northeastern United States</td>
<td>Leaves broad, coarsely toothed, with flattened leafstalks.</td>
</tr>
<tr>
<td>52. Big-toothed aspen (Populus grandidentata)</td>
<td>Northern United States</td>
<td>Leaves broad at base, finely toothed, fruit a papery cone which falls apart when ripe, bark peeling off in thin sheets.</td>
</tr>
<tr>
<td>53. Paper birch (Betula papyrifera)</td>
<td>do</td>
<td>Bark dark brown, hard and close, not peeling off in sheets, tiny scales of cones smooth, not minutely hairy along edges as in yellow birch.</td>
</tr>
<tr>
<td>54. Sweet birch (Betula lenta)</td>
<td>Northeastern United States</td>
<td>Bark yellow gray, tiny scales of the cones minutely hairy along edges.</td>
</tr>
<tr>
<td>55. Yellow birch (Betula lutea)</td>
<td>Eastern United States</td>
<td>Leaves heart-shaped, sharply toothed. Fruit red or black. The white mulberry comes from Asia.</td>
</tr>
<tr>
<td>56. Red mulberry (Morus rubra)</td>
<td>do</td>
<td>Leaves pointed, finely toothed, fruit red or yellow with short stalks, branches somewhat spiny, calyxlobes of flowers with smooth edge.</td>
</tr>
<tr>
<td>57. Wild plum (Prunus americana)</td>
<td>do</td>
<td>Small tree or shrub. Fruit bright red when ripe, long stalked in clusters of 3 to 5.</td>
</tr>
<tr>
<td>58. Wild red cherry (Prunus pensylvanica)</td>
<td>do</td>
<td>Fruit in a long cluster, ripe berries mostly at base, no remains of flower persisting.</td>
</tr>
<tr>
<td>59. Choke cherry (Prunus virginiana)</td>
<td>do</td>
<td>Fruit resembles choke cherry, but with remains of flower attached to base of the cherries.</td>
</tr>
<tr>
<td>60. Wild black cherry (Prunus serotina)</td>
<td>do</td>
<td>Leaves large, blunt or with deep notch at end; flowers large; yellow, fruit a Woody Berry cone.</td>
</tr>
<tr>
<td>61. Yellow or tulip poplar (Liriodendron tulipifera)</td>
<td>do</td>
<td>Leaves oval, with one lobe like a “mitten,” or with a lobe on each side. Twigs fragrant.</td>
</tr>
<tr>
<td>62. Sassafras (Sassafras sassafras)</td>
<td>do</td>
<td></td>
</tr>
<tr>
<td>Name.</td>
<td>Distribution.</td>
<td>Remarks.</td>
</tr>
<tr>
<td>----------------------------------------------------</td>
<td>------------------------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>63. Black gum (Pepperidge) (Nyssa sylvatica).</td>
<td>Eastern United States..............</td>
<td>Leaves oval with smooth edge. Fruit, an elongated berry with seed but little flattened and stone scarcely ridged.</td>
</tr>
<tr>
<td>64. Water gum (Nyssa bidentata).</td>
<td>Southern States....................</td>
<td>Resembling black gum, but fruit which also grows in pairs, has a flattened and ridged stone.</td>
</tr>
<tr>
<td>65. Tupelo gum (Nyssa aquatica).</td>
<td>Swamps of Southeastern Coastal States.</td>
<td>Fruits produced singly, with a stalk longer than the fruit; stone of fruit sharp-edged or winged.</td>
</tr>
<tr>
<td>66. Gopher plum (Nyssa ovata).</td>
<td>Swamps, South Carolina to Florida.</td>
<td>Resembling Tupelo gum, but fruits with a stalk shorter than the fruit itself.</td>
</tr>
<tr>
<td>68. Cucumber tree (Magnolia acuminata).</td>
<td>Southeastern States..............</td>
<td>Flowers white, leaves deeply lobed at base, forming “ears,” green on underside.</td>
</tr>
<tr>
<td>69. Umbrella tree (Magnolia fraserei).</td>
<td>do..............................</td>
<td>Flowers white, leaves very large, with “ears” at base, and white beneath. Largest leaved tree in North America (20 to 30 inches long).</td>
</tr>
<tr>
<td>70. Large-leaf magnolia (Magnolia macrophylla).</td>
<td>Eastern United States..............</td>
<td>Leaves oval, smooth, with smooth margin, fruit orange colored, 1 to 1½ inches in diameter, edible in late fall.</td>
</tr>
<tr>
<td>71. Persimmon ( Diospyros virginiana).</td>
<td>do..............................</td>
<td>Leaves heart-shaped, smooth margin; fruit a pea-like pod in clusters of 4 to 8; flowers resembling a small rose-colored sweet pea.</td>
</tr>
<tr>
<td>72. Redbud (Judas tree) (Cercis canadensis).</td>
<td>Native to Arkansas, eastern Oklahoma and Texas, but widely planted throughout Eastern United States.</td>
<td>Leaves with smooth edges. Fruit a heavy ball 4 to 5 inches in diameter.</td>
</tr>
<tr>
<td>73. Osage orange (Bois d'arce) (Toxylon pomiferum).</td>
<td>Eastern United States..............</td>
<td>Leaves 3 to 5 lobed with large rounded teeth; fruit a pair of keys ripening in autumn.</td>
</tr>
<tr>
<td>74. Sugar maple (Acer saccharum).</td>
<td>do..............................</td>
<td>Leaves deeply 5-lobed, with sharp irregular teeth; fruit ripening in spring before appearance of leaves. Leaves 3 to 5 lobed, finely toothed; fruit ripening in spring or early summer.</td>
</tr>
<tr>
<td>75. Silver maple (Acer saccharinum).</td>
<td>do..............................</td>
<td>Leaves large, heart-shaped; fruit a long “pod” filled with flat seeds which are tufted at each end. A better-shaped tree than common catalpa (Catalpa Catalpa).</td>
</tr>
<tr>
<td>76. Red maple (Acer rubrum).</td>
<td>do..............................</td>
<td>Leaves mostly clustered at ends of branches, with slightly wavy margins; flowers white with four large bracts resembling petals. Leaves opposite.</td>
</tr>
<tr>
<td>77. Box elder or ash-leaved maple (Acer negundo).</td>
<td>Throughout United States........</td>
<td>Leaves resembling those of flowering dogwood, but alternate in arrangement; flowers without the four large petal-like bracts.</td>
</tr>
<tr>
<td>78. Hardy catalpa (Indian cigar) (Catalpa speciosa).</td>
<td>South Central States, widely cultivated elsewhere.</td>
<td>Leaves double-compound, the leaflets with slightly wavy margins; fruit a pod a foot or more in length, twisted when dry. Trees with large branching thorns.</td>
</tr>
<tr>
<td>79. Flowering dogwood (Cornus florida).</td>
<td>Eastern United States..............</td>
<td>Leaves compound, leaflets with smooth margins; fruit a pod 3 to 4 inches long. Trees with pairs of short thorns at the base of leaves and twigs. Wood heavy and durable in the ground.</td>
</tr>
</tbody>
</table>
| 80. Blue dogwood (Cornus alternifolia).             | Northeastern States and Appalachian Mountains. | Leaves double compound, the leaflets with slightly wavy margins; fruit a pod a foot or more in length, twisted when dry. Trees with large branching thorns.伍
| 81. Honey locust (Gleditsia triacanthos).            | Central States and Minnesota to Texas. Widely cultivated elsewhere. | Leaves double-compound, the leaflets with slightly wavy margins; fruit a pod a foot or more in length, twisted when dry. Trees with large branching thorns.伍
<p>| 82. Black locust (Yellow locust) (Robinia pseudacacia). | Appalachian region, widely cultivated and naturalized all over United States. | Leaves double compound, the leaflets with slightly wavy margins; fruit a pod 3 to 4 inches long. Trees with pairs of short thorns at the base of leaves and twigs. Wood heavy and durable in the ground. |
| 83. Kentucky coffee tree (Gymnocladus dioicus).     | Ohio and Mississippi valley....... | Leaves double compound, the leaflets with slightly wavy margins; fruit a pod 3 to 4 inches long. Trees with pairs of short thorns at the base of leaves and twigs. Wood heavy and durable in the ground. |
| 84. Pecan (Hicoria pecan).                          | Mississippi Valley............... | Leaves double compound, the leaflets with slightly wavy margins; fruit a pod 3 to 4 inches long. Trees with pairs of short thorns at the base of leaves and twigs. Wood heavy and durable in the ground. |
| 85. Bitternut hickory (Hicoria minima).              | Eastern United States.............. | Nut broader than long, with bitter kernel. |</p>

<tbody>
<tr>
<td>86. Water hickory (<em>Hicoria aquatica</em>).</td>
<td>Gulf States and lower Mississippi Valley.</td>
<td>Nut broad, with bitter kernel.</td>
</tr>
<tr>
<td>87. Shagbark hickory (<em>Hicoria ovata</em>).</td>
<td>Eastern United States.</td>
<td>Buds with many scales (all of the preceding hickories have buds with few scales), nuts not flanged at joints, shell thick and bony. Bark loosening from trees.</td>
</tr>
<tr>
<td>88. Shellbark hickory (<em>Hicoria laciniosa</em>).</td>
<td>do.</td>
<td>Difficult to distinguish from shagbark hickory. Twigs are pale orange, while in the preceding they are light red-brown.</td>
</tr>
<tr>
<td>89. Mockernut hickory (<em>Hicoria alba</em>).</td>
<td>do.</td>
<td>Bud scales many, bark closely furrowed not separating from the trunk. Nut oblong.</td>
</tr>
<tr>
<td>90. Pignut hickory (<em>Hicoria glabra</em>).</td>
<td>Southern States.</td>
<td>Leaves compound, with toothed edges; fruit growing singly or in pairs rounded; bark brown.</td>
</tr>
<tr>
<td>91. Black walnut (<em>Juglans nigra</em>).</td>
<td>Eastern United States.</td>
<td>Leaves compound, with toothed edges; fruit in hanging clusters of 3 to 5, pointed and elongated. Velvety cushion just above leaf-scar; bark gray.</td>
</tr>
<tr>
<td>92. Butternut or white walnut (<em>Juglans cinerea</em>).</td>
<td>do.</td>
<td>All species of ash are difficult to identify, and mostly require expert knowledge of the fruit or &quot;keys.&quot; White ash has a key or fruit with a plump well rounded body and a wing extending almost entirely from the end.</td>
</tr>
<tr>
<td>93. White ash (<em>Fraxinus americana</em>).</td>
<td>do.</td>
<td>Differs from white ash in having young twigs velvety and wing of seed extending down along sides of seed-body.</td>
</tr>
<tr>
<td>94. Red ash (<em>Fraxinus pennsylvanica</em>).</td>
<td>do.</td>
<td>Like the preceding, except twigs are smooth.</td>
</tr>
<tr>
<td>95. Green ash (<em>Fraxinus lanceolata</em>).</td>
<td>do.</td>
<td>Resembling red ash, but fruits are very much larger, sometimes twice the size.</td>
</tr>
<tr>
<td>96. Pumpkin ash (<em>Fraxinus profunda</em>).</td>
<td>Southern States.</td>
<td>Fruits with a flat wide wing, which extends conspicuously down the sides of the seed body.</td>
</tr>
<tr>
<td>100. Yellow Buckeye (<em>Euscclus octandra</em>).</td>
<td>do.</td>
<td></td>
</tr>
